No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Synthesized Hammerhead Ribozyme
The letter 'n' stands for any base or bases forming a loop or
stem-loop
that may contain multiple nucleic acid analogues or 2'- CC
deoxynucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      2

Myosin, heavy chain, non-invasive, hypertrophic cardiomyopathy, diagnosis, primer; mutation, detection, 88. Beta-cardiac myosin heavy chain PCR primer B9.1F. (HARD) HARVARD COLLEGE. (BGHM) BRIGHAM & WOMENS HOSPITAL. (GEHO-) GEN HOSPITAL SHENYANG MILITARY AREA. AAQ91129 standard; cDNA; 25 BP. 92US-00989160. 92US-00989160. 19-FEB-1996 (first entry) 11-DEC-1992; 11-DEC-1992; 04-JUL-1995. US5429923-A. Synthetic. AAQ91129; AAQ91129

Non-invasive method for diagnosis of hypertrophic cardio-myopathy useful for testing asymptomatic individual(s). WPI; 1995-245715/32.

Watkins H, Rosenzweig A;

Seidman J, Seidman C,

Example 1; Col 10; 22pp; English

AAQ91121-Q91130 are nested PCR primers used for the amplification and identification of beta-cardiac myosin heavy-chain RNA. They are used in a new non-invasive method for diagnosing hyperrophic cardiomyopathy (HC), the method involves detecting the presence or absence of specific HC associated mutations in the beta-cardiac myosin heavy-chain obtained from a blood sample. The method may be used to diagnose familial or sporadic HC and the non-invasive method is particularly important when testing

oligonucleotides capable of amplifying beta-cardiac myosin heavy-chain

The mutations associated with SHC/FHC are detected in the myosin gene isolated from blood, by detecting mis-matched areas in RNA-DNA hybrid double strands (RNA from the normal gene, DNA from the suspect ample). FHC associated point mutation can be classified and used to determine life expectancy in affected individuals e.g. using a Kaplan-Meier curve for the classified type of FHC causing point mutation. Also included are an RNA probe comprising ribonucleotides arranged in a sequence which is complementary to at least a portion of beta-cardiac myosin heavy-chain DNA and a set of DNA oligonucleotide primers for amplifying beta-cardiac myosin heavy-chain DNA comprising at least two
asymptomatic individuals suspected of having the disease. The method has a broad applicability and may be used to detect mutations responsible for other genetically inheritable diseases e.g. cystic fibrosis, Gaucher's disease, haemophilia A and B, buchenne's muscular dystrophy, sickle cell anaemia, Tay-Sachs disease and phenylketonuria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; ss; PCR; primer; beta cardiac myosin heavy chain; FHC; familial hypertrophic cardiomyopathy; SHC; Gaucher's disease; sporadic hypertrophic cardiomyopathy; life expectancy; haemophilia; buchenne's muscular dystrophy; sickle cell anaemia; Tay-Sachs disease; phenylketonuria; cystic fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting a presence or absence of a mutation associated with hypertrophic cardiomypachy, useful for diagnosing cystic fibrosis or hemophilia, by detecting a mutation in an amplified product of a beta cardiac myosin heavy-chain DNA.

             DNA. The method is useful for detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy. This method is usepecially useful for diagnosing SMC and PHC, as well as for determining the estimated the life expectancy of a person with familial hypertrophic cardiomyopathy. In particular, the method is useful for determining individual's genetic information, and diagnosing e.g. Gaucher's disease, haemophilla, Duchenne's muscular dystrophy, sickle cell ansemia, Tay-Sachs disease, phenylketonuria or cystic fibrosis. The present sequence is a PCR primer used to amplify a region of the beta cardiac myosin heavy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy (familial or sporadic, FHC, SHC) for facilitating the diagnosis of hypertrophic cardiomyopathy, comprising amplifying beta-cardiac myosin heavy-chain DNA forming an associated product, and detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy in the amplified product, thus, facilitating the diagnosis of hypertrophic cardiomyopathy. Also included are a set of DNA oligonucleotide primers for amplifying beta-cardiac myosin heavy-chain DNA comprising at least two oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detecting mutations associated with hypertrophic cardiomyopathy to diagnose hypertrophic cardiomyopathy, comprises amplifying beta-cardiac myosin heavy-chain DNA and detecting the mutation in the amplified product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human beta cardiac myosin heavy chain mutation detection primer B9.1F.

Novel recombinant DNA molecules and polypeptides for treating apoptosis mediated diseases e.g. autoimmune diabetes, cancer and Parkinson's disease,

Example 7; Page 33; 69pp; English.

```
The invention provides recombinant nucleic acid molecules encoding usurpin-alpha (lacking the first death effector domain (DED) or its prodomain, usurpin-beta or usurpin-gamma. Usurpin polypeptides are useful for in vitro and in vivo identification of usurpin-procaspase interaction inhibitor. Usurpin is useful as modulator of the sensitivity of cells to CD95[Res/Apo-1] mediated approcise; Modulation of appptosis is useful for treating disease like autoimmune diabetes, cancer and parkinson's disease. Activators and inhibitors of usurpin-procaspase interaction are also useful for treating various diseases mediated by apoptosis. Usurpin provides an attractive model for modulating caspase activation. Sensitivity of cells bearing CD95(Res/Apo-1) receptor can be regulated at several levels in the presence of usurpin, conferring resistance to Fas-ligand cell death. The present sequence represents a forward amplimer for generating usurpin-alpha, delDED-A usurpin
                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human genome, biallelic marker; high density disequilibrium map; genomic map; haplotype; phenotype; polymorphic base; genotyping; haplotyping; hybridisation; identification; characterisation; diagnosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel biallelic markers used to construct a high density disequilibrium map of the human genome.

The invention provides recombinant nucleic acid molecules encoding usurpin-alpha (lacking the first death effector domain (DED) or its prodomain, usurpin-beta or usurpin-agama. Usurpin polypeptides are useful for in vitro and in vivo identification of usurpin-procapase-8 interaction inhibitor. Usurpin is useful as modulation of apoptosis of cells to CD95(Fas/Apo-1) mediated apoptosis. Modulation of apoptosis is useful for treating diseases like autoimmune diabetes, cancer and Parkinson's disease. Activators and inhibitors of usurpin-procapase-8 interaction are also useful for treating various diseases mediated by apoptosis. Usurpin provides an attractive model for modulating caspase activation. Sensitivity of cells bearing CD95(Fas/Apo-1) receptor can be resistance to Fas-ligand cell death. The presence of usurpin, conferring resistance to Fas-ligand cell death. The present sequence represents a forward amplimer for generating delDED-A usurpin constructs
                                                                                                                                                                                                                                                                                                                                                ö
have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The primer was used in conjunction with primer TAFI285 (see AAQ24359) to obtain a DNA fragment encoding a 5'-3' exchuclease deficient thermostable DNA polymerase from Thermosipho africanus. A portion of the DNA polymerase gene comprising amino acids 285-892 was selectively amplified using the two PCR primers and the purified prod. isolated. The purified protein is deficient in 5'-3' exc. nuclease activity, is more thermoresistant than the corresp. native enzyme and is partic. useful in PCR of G+C rich templates. New polypeptide-human lysyl oxidase 46.31 for treating malignant tumor, hemopathy, human immunodeficiency virus infection, immunological disease and various inflammations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polypeptide-human lysyl oxidase 46.31 for treating malignant tumor, hemopathy, human immunodeficiency virus infection, immunological disease
                                                                                                                                                                                                                                                                                                                                                                                                                        described is a process for producing (1) using DNA recombination technology. (1) can be used in the treatment of several diseases, such amalignant tumour, haemopathy, human immunodeficiency virus (HIV) infection, immunological disease and various inflammations. The present sequence represents a PCR primer for (1), which is used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, lysyl oxidase 46.31; enzyme; malignant tumour; haemopathy; human immunodeficiency virus infection; HIV infection; inflammation; immunological disease; probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes human lysyl oxidase 46.31 (I).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of forward PCR primer ST239ABMF, which was used with reverse primer ST239ABTCR (see AAF30390) for the PCR undplication of human full-length ADAMB DDNA (see AAF30377). The forward primer includes an NsII restriction site toward the 5' end followed by the sequence at the beginning of the mature sequence of ADAMB. The PCR product was used in the construction of plasmid pST239.ADAMBmat for expression of mature ADAMB protein (see AAB20251) in Bscherichia coli strain 58F3 cells. The ADAMB gene is amplified in the genome of certain tumour cells. Such gene amplification is associated with overexpression of ADAMB protein and contributes to tumourigenesis. ADAMB is therefore a useful target for the diagnosis and/or treatment of certain cancers. Therapeutic agents may take the form of anteagonists of ADAMB, such as anti-ADAMB antibodies, or may be ADAMB antisense constructs

           The present invention describes human lysyl oxidase 46.31 (I). Also described is a process for producing (I) using DNA recombination technology. (I) can be used in the treatment of several diseases, such as malignant tumour, haemopathy, human immunodeficiency virus (HIV) infection, immunological disease and various inflammations. The present sequence represents a probe for (I), which is used in an example from the

The present invention describes a method for detecting a nucleic acid target (T) in a sample (S). The method involves: (a) contacting (S) which may comprise the target(S) with a nuclease protection fragment(S) (I) specific for and which binds to the target(S), exposing the (S) to a nuclease effective to digest remaining single stranded nucleic acid, and then contacting the resultant (S) with a combination (II) which comprises, before addition of (S), a surface comprising multiple spatially discrete regions at least two of which are substantially discrete regions at least two of which are substantially the anchors at each locus, each in association with a bifunctional linker which has a first portion that is specific for the anchor, and a second portion that comprises a probe which is specific for the combination, where two or more of the anchors located at a first locus of a region are in association with different bifunctional linkers, having different target specificities, and (b) detecting the bound protection fragment (S), and where the regions are tubes, and the loci of anchors are arranged in a

linear array in the tubes. Such an assay can be termed a multi array plate screen (MAPS) method or assay. When the probes are oligonucleotides, the MAPS can be used for diagnosing the presence of genetic variations or defects e.g. polymorphisms or specific mutations associated with disease such as cystic fibrosis or pathogenic organisms. When the probes are antigen binding molecules, the assays can be used for screening variant proteins or protein expression patterns. The assay can also be used for mapping expressed sequence tags (ESTs). ABZ7259 to ABZ72762, and ABPS6911, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PCR; primer; ss; actin; 21.34; zinc finger; PHD structural domain; int tumour; haemopathy; HIV; immunological disease; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polypeptide-human actin 21.34 contained zinc finger and PHD finger
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises the amino acid and coding sequence of the human actin 21.34 protein (which contains a zinc finger and a PHD structural domain). The 21.34 DNA and protein sequences are useful for treating: malignant tumour; haemopathy; HIV; immunological disease; and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               malignant tumour; haemopathy; HIV; immunological disease; and inflammations. The present DNA sequence represents a PCR primer for the human actin 21.34 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         structural domain and its encoding polynucleotide useful for treating
                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention describes isolated tor-1, tor-2 polypeptides (I). A vector comprising a polynucleotide (II) encoding (I) is useful for making a corsin polypeptide which involves culturing the vector for a duration of time under conditions suitable for expression of the torsin polypeptide of a polynucleotide that is 70-90% or more identical to (II) is useful for detecting a polynucleotide encoding a polypeptide having 70% or more for more protein a polynucleotides and polypeptide having torsin activity. The polynucleotides and polypeptides of the invention are useful for treating symptoms or treating one or more protein-aggregation-associated disease or which involves administering the polynucleotides or polypeptides to a human being or an animal in need. The one or more protein-aggregation-associated disease, tasopath is a closen from Alzheimer's disease, Parkinson's disease, dystonia, and familial amyotrophic lateral sclerosis. (I) is useful for controlling expression of one or more isolated polypeptides having amino acid sequence identical to (I) in an organism. This sequence represents a reverse transcriptuse, PCR primer used in the isolation of
                                                                                                                                                                                                             nootropic; neuroprotective; antiparkinsonian; anticonvulsant; protein aggregates formation supressor; gene therapy; tor-1; tor-2; torsin; protein-aggregation-associated disease; Alzheimer's disease; Parkinson's disease; prion disease; tauopathy; Huntington's disease; polyglutamine disease; dystonia; familial amyotrophic lateral sclerosis; worm; tor-2; reverse transcriptase PCR; primer; ss; torsin-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel isolated tor-1, tor-2 polypeptides, useful for treating protein-aggregation-associated diseases e.g. Alzheimer's disease, Parkinson's disease, prion disease, tauopathy and Huntington's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61.6%; Score 15.4; DB 12; Length 36; 76.0%; Pred. AAQ85137 and AAQ95138 are a pair of primers for the PCR amplification of AAQ84793, a new autosomal dominant spinocerebellar ataxia type 1 (SCA 1) nucleic acid. The nucleic acid and its protein product (AAR71111) can be used to develop products, for the presymptomatic detection of a SCA 1 disorder. (Updated on 25-MAR-2003 to correct PN field.)

New autosomal dominant spinocerebellar ataxia type 1 nucleic acid - used to develop prods. for detection or presymptomatic diagnosis of a SCA1

                                                                                                                                                             This sequence represents DNA encoding the human homologue of the murine alpha myosin heavy chain-derived peptide, M7A-alpha (AAY4723). Like M7A-alpha anyosin heavy chain-derived peptide, M7A-alpha (AAY4723). Like M7A-alpha, the human homologue inflammatory cardiomyopathy (ICM) via an autoimmune response in mice immunised with it. It contains an amino acid sequence motif MAXXXS (AAY42722) which appears to be required for the induction of this disease. The motif was originally identified in M7A-alpha when it was compared with a peptide derived from a homologues can did not cause the disease. Several peptide fragments containing the motif were identified from a database and were found to be fragments of Chlamydia. These peptides also induced ICM, indicating that infection with Chlamydia may be involved in the development of ICM. Inflammatory cardiomyopathy peptides are used to determine the risk of ICM by incubation with a subject's T cells and measuring the degree of proliferation (an increased degree being indicative of risk) or to raise specific antibodies which can be used therapeutically and for the detection of Chlamydia. Such can be used measuring an adjuvant and an excipient in a vaccine

This sequence represents the cooling sequence or the numan nomologue of the murine many halpha peptide (Y83811) derived from the murine alpha myosin heavy chain polypeptide. The peptide was used to evaluate its ability to induce autoimmune inflammatory cardiomyopathy. A similar experiment was carried out using the peptide WAA-beta (Y8381). The invention relates to the isolation of sequences coding for peptide experiments are searched based on the sequence cardiomyopathy. The peptide sequences are searched based on the sequence of the MTA peptides derived from the murine alpha myosin heavy chain polypeptide. The consensus sequence of the murine MTA-alpha/beta peptides of the MTA peptides derived from the murine of the murine of the sequence of the murine solar and viral sequences able to cause inflammatory cardiomyopathy. The screen isolated the peptides valsals and their corresponding coding and viral sequences able to cause inflammatory cardiomyopathy. The screen isolated the peptides with other therapeutics, for inducing or inhibiting or inflammatory cardiomyopathy in vivo, where the cardiomyopathy is autoimmune inflammatory cardiomyopathy. The peptides may also be used for increasing inflammatory cardiomyopathy. The peptides may also be used for increasing the mammal. The peptides may also be used in vaccines. Nucleic acids encoding the peptides may also be used in vaccines.

Nucleic acids encoding the peptides may be used as hybridization probes, con in diagnostic assays to test for the presence of Chlamydia DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                       DNA molecules encoding novel myocardial peptides used for inhibiting and inducing inflammatory cardiomyopathy in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                The present invention describes human lysyl oxidase 46.31 (I). Also described is a process for producing (I) using DNA recombination technology. (I) can be used in the treatment of several diseases, such as malignant tumour, haemopathy, human immunodeficiency virus (HIV) infection, immunological disease and various inflammations. The present sequence represents a probe for (I), which is used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for adagnosing a disease, monitoring (rate of) propression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response
                 otide-human lysyl oxidase 46.31 for treating malignant tumor, human immunodeficiency virus infection, immunological disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      17; leukocyte; gene expression profiling; allograft rejection; atherosclerosis; congestive heart failure; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; cytomegalovirus; infection; probe;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a system for detecting gene expression, which gene rouncises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                    17; leukocyte; gene expression profiling; allograft rejection; atherosclerosis; congestive heart failure; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; cytomegalovirus; infection; probe;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New system for leukocyte expression profiling, diagnosing a disease, or monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides.

This invention relates to a novel nucleic acids, and encoded polypeptides thereof, which have properties related to the stimulation of biochemical or physiological responses in a cell, tissue, organ or organism.

Specifically, it refers to the use of biologically active fragments for diagnostic and prognostic assays and furthermore in the treatment of diagnostic and prognostic assays and furthermore in the treatment of diagnostic and prognostic assays and furthermore in the treatment of cliverse pathological conditions. The present invention describes novel human and murine NOVX proteins, as well as methods to modulate their expression using antisense oligos, ribozymes and peptide nucleic acids.

The polypeptides, nucleic acid molecules and antibodies are useful in the manufacture of a medicament for treating metabolic disorders, diabetes, and haematopoietic diseases as well as various dyslipidaemias.

Accordingly, these molecules have many activities including anorectic, virucide, nootropic, antiinflammatory, neuroprotective, antilipaemic, anabolic and cardiant. Purthermore, they are useful in screening assays to identify small molecules that modulate or inhibit, for example, neurogenesis, wound healing and angiogenesis. The nucleic acids are also used as in chromosome amapping, tissue typing, preventive medicine and pharmacogenomics. This oligonucleotide is a PCR primer used to amplify human NOVX DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis, or diabetes, and in chromosome mapping, tissue typing or

The invention relates isolated 162 NOVX polypeptides (NOV1-NOV99, including splice variants) and the nucleic acids (NA) that encode them. Also included are the mature NOVX proteins (and their encoding polynucleotides), a vector comprising NOVX NA, a cell comprising the presence or amount of NOVX in a sample, determining the presence or amount of NOVX in a sample, determining the presence or amount of NOVX in a sample, determining the presence or amount of NOVX in a sample, determining the presence of alsoader, determining the presence of or predisposition to a disease associated with altered levels of NOVX and treating a pathological state in a mammal comprising administering a polypeptide which is at least 95% in a mammal comprising administering a polypeptide which is at least 95% in a mammal comprising administering a polypeptide which is at least 95% in appropriate expression and activity of NOVX (e.g. cancer, diabetes, prevention, treatment and diagnosis of diseases associated with cardionyopathy and/or atherocelerosis). The anti-NOVX antibodies and cardiomyopathy and not a samples (e.g. by enzyme linked a manual comprises may also be used to down regulate expression and activity of NOVX. The anti-NOVX antibodies may also be used as diagnostic agents for detecting the presence of NOVX in samples (e.g. by enzyme linked immunosorbant assay (ELISA). The agents and methods may be used in this way to prevent, diagnose and treat cancer, diabetes, cardiomyopathy now the presence of NOVX in samples is a real time quantitative and not cancer, diabetes, cardiomyopathy now the presence of NOVX in sequence is a real time quantitative and not cancer.

```
The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AAZ33891 to AAZ34338, and AAY41685 to AAY41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                       secreted and transmembrane polypeptides and their polynucleotides ful for treating blood coagulation disorders, cancers and cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The PRO polynuclectides and polypeptides have eytostatic activity. The polynuclectides and polypeptides have eytostatic activity. The polynuclectides and polypeptides can be used for detecting the presence of PRO polypeptides is samples, for linking biological activities of feels using the polypeptides and for modulating biological activities of calls for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bioactive molecules to cells. AAC78600 to AAC78897 represent PCP primers and probes used in the isolation of the PRO polynucleotide sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ', Gerber H, Gerritsen ME;

                                                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes an isolated nucleic acid (I) comprising, or which is at least 80 % sequence identity to, or the full-length coding sequence off, any of 118 300-2100 nucleotide sequences, which encodes its corresponding PRO polypeptide selected from 118 100-700 amino acid sequences, all given in the specification. The nucleic acids and polypeptides are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, or diabetic complications. The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as pharmaccuticals, diagnostics, biosensors or bioreactors. Both are useful in tissue typing. This sequence represents a novel human secreted and transmembrane PRO polypeptide associated primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, or

```
polypeptide is also useful as a thrombolytic agent, interferon, interfleukin, erythropoletin, colony stimulating factor and other cytokines. The PRO polypeptide is useful for treating disease such as cancer e.g. colorectal carcinoma; useful for treating disease such as cancer e.g. colorectal carcinoma; apoptosis related conditions e.g. AIDS, amyotrophic lateral sclerosis; inflammatory disease e.g. asthma, catherosclerosis; neurodegenerative disease e.g. Alzheimer's disease, Parkinson's disease; cardiovascular disease e.g. Alzheimer's disease, Parkinson's disease; lung disease e.g. pulmonary hypertension and myocardial ischaemia; kidney disease e.g. renal failure and asthma; gastrointestinal disorders e.g. pulmonary hypertension, bronchial asthma; gastrointestinal disorders e.g. gastric ulcer and inflammatory bowel disease; reproductive disorders e.g. premature labour and present associated oligonucleotide of the invention. The PRO polypeptide is useful in PRO polypeptide detection methods. The PRO polypeptide is useful for linking a bioactive melecule to a cell. The PRO polypeptide or an antibody against it is useful for modulating a biological activity of a cell. The PRO polypeptide is useful in industrial applications including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated PRO polypeptides e.g. PRO213, PRO274 and PRO300, for use as pharmaceuticals, diagnostics, biosensors and bioreactors, for identifying modulators of receptor-ligand interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1, Baker KP, Botstein D, Desnoye

(GETH) GENENTECH INC.

The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for modulating bloactive molacules to cells expressing PRO polypeptides, for modulating bloactive molacules to calls expressing PRO polypeptides, and for for chordifying agonists or antagonists. The bloactive molecule maybe a coxin, radiolabel or antibody, and causes apoptosis or death of the cell. The PRO polypeptides are useful for treating immune disorders, diabetes or hyper-or hypo-insulinaemia, cardiac insufficiency, nervous system disorders, kidney disorders, bone and cartilage disorders or arthritis, tumours, and wound healing. The polynucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene mapping, in the generation of antisense RNA and DNA, in the presartion of PRO polypeptides, for generating transgenic animals or knockout animals, for the generation of antisense RNA and DNA, in the presartion of PRO polypeptides of the present sequence represents a PCR primer used in the examples of the present invention. Note: The sequence data for this at seqdata.uspto.gov/psipsDDEntry.html I, Baker KP, Botstein D, Desnoyers L, Eaton D;

New genes and secreted and transmembrane polypeptides (e.g. PRO337 or PRO1559), useful for treating or diagnosing e.g. cancers, atherosclerosis, infertility, stroke, encephalitis, hepatitis or multiple sclerosis in mammals.

Example 23; Page 135; 460pp; English.

The invention relates to a new isolated nucleic acid molecule comprises a sequence with at least 80% identity to: (a) a nucleotide encoding any of 94 ROY polypeptides whose sequences are fully defined in the specification; or (b) any of 94 mucleotide sequences fully defined in the specification; or the full length coding sequence fully defined in the corring at least 80% positives when compared to any of the PRO polypeptide corring at least 80% amino acid sequence identity to: (a) an amino acid sequence identity to: (a) an amino acid sequence identity to: (a) an amino acid sequence identity to: (b) the PRO polypeptide having at least 80% amino acid sequence identity to: (a) an amino acid sequence identity to: (b) the PRO polypeptide, lacking its associated signal peptide, a vector comprising the wettor (and producing a PRO polypeptide), a chimaeric molecule comprising the PRO polypeptide, with or lacking its associated signal peptide), a vector (and producing a PRO polypeptide), a chimaeric molecule comprising the PRO polypeptide fused to a heterologous amino acid sequence and an anti-PRO antibody. The PRO polypeptides or polymorelocides are useful as pharmacenticials, color-cetal cancer, asrcoma, lenkaemia or lampional, inflammatory disease, nearly disease, necrosis, atherosclerosis, infertility, premature aging, psoriasis, inflammatory disease, renal disease, arthritis, immune-mediated alopecia, stroke, encephalitis, hepatitis, or multiple solerosis in mammals. The PRO polypeptides are useful in drug screening, particularly as targets for therapeutic intervention in these diseases. The PRO polypeptides are useful as molecular weight markers, or for chromosome content to the presence of these diseases. The PRO genes are useful as bob used in gene therapy, particularly for replacing a defective and the procure of human cDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective cDNA encoding a PRO polypeptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes an isolated secreted and transmembrane (PRO) polypeptide (I). PRO337 polypeptide is useful for detecting PRO4993 polypeptide in a sample, and vice versa. PRO725, PRO700 and PRO739 are useful for detecting PRO1559 polypeptide in a sample, and PRO1559 is useful for detecting PRO559, PRO700 and PRO739 in a sample. PRO4993 is useful for linking a bioactive molecule to a cell expressing a PRO493 polypeptide, and PRO337 is useful for linking a bioactive molecule to cell expressing a PRO493 polypeptide. PRO1559 is useful for linking a bioactive molecule to a cell expressing a PRO493 polypeptide. PRO700 and PRO739 polypeptide, and PRO735, PRO700 and PRO739
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    / Match 59.2%; Score 14.8; DB 9; Length 24; Local Similarity 88.9%; Pred. ```
The invention describes an isolated, secreted and transmembrane polypeptide, termed PRO polypeptide (1). (1) is useful for detecting PRO4993, PRO373, PRO185, PRO785, PRO789 polypeptide, and for linking a bioactive molecule to a cell expressing the above polypeptides. The bioactive molecule is a toxin, radiolabel or an antibody and causes cell death. (1) is useful as therapeutic agent, in medical and industrial applications e.g. for treating neuropathy, especially peripheral neuropathy, diabetic peripheral neuropathy, AIDS-associated neuropathy, charcot-Marie-Tooth disease, Refusum's disease, Abetalipoproteinaemia, Tangier disease, Krabbe's disease, Metachromatic leukodystrophy, Fabry's
                                                                                                                                                                                                                                                                                                                                                                                                                         Ashkenazi AJ, Baker KP, Botstein D, Desnoyers L, Eaton DL; Ferrara N, Filvaroff E, Fong S, Gao W, Gerber H, Gerritsen ME; Goddard A, Godowski PJ, Grimalaldi JC, Gurney AL, Hillan KJ; Klo SS, Napier MA, Pan J, Paoni NF, Roy MA, Shelton DL; Stewart TA, Tumas D, Williams PM, Wood WL;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel secreted and transmembrane polypeptide for modulating biological activity of cell expressing the polypeptide, identifying agonists or antagonists of polypeptide, and as molecular weight markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..

                                                                                                                                                                                      The present invention relates to the isolation of novel human PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for inking bioactive molecules to cells expressing PRO polypeptides, for modulating biological activities of cells expressing PRO polypeptides, and for identifying agonists or antagonists. The bioactive molecule maybe a toxin, radiolabel or antibody, and cause cell death. The PRO polypeptides are useful for treating neuropathy and neuropathy related diseases such as Charcot-Marie-Tooth disorder, Refeum's disease, and Krabbe's disease. The polymucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for
                                                                                              New PRO polypeptides useful for treating peripheral neuropathy, neuropathies associated with systemic disease such as post-polio syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; ss; PCR; secreted protein; transmembrane protein; PRO; cytostatic; ophthalmological; antiarthritic; osteopathic; antirheumatic; vulnerary; auditory; tumour growth; retinal disorder; sports-related joint problem; articular cartilage defects; osteoarthritis; rheumatoid arthritis; wound healing; hearing loss; primer.

The Invention Observines an isolated secreted and transmembrane known the Invention Observines an isolated such as PR0213, PR0700, PR0320 or PR0615 is useful in biotechnological and medical research, as well as in various industrial applications. PR0 polypeptide such as PR0310, PR0320, PR0323, PR0320, PR0321, PR0351, PR0351, PR0313, PR0615, PR0712, PR0853, PR0320, PR0860 or PR0846 is useful for therapeutic purposes. PR0361 is useful to the reatment of wound healing, tissue growth and therapeutically in vivo for lessening the effects of viral infection. PR0300 is useful for the treatment of wound healing, tissue growth and muscle generation and regeneration. PR0317 is useful for treating contraction and regeneration. PR0317 is useful for treating contraction. PR0317 is useful for generating transgenic animals or knockout animals which are useful for generating transgenic animals or knockout animals which are useful for generating transgenic animals or knockout animals which are useful for generating sequences, and to construct hybridisation probes for reagents, as probes for generating a pool of sequences for identifying reagent with genetic disorders, for recombinantly expressing (1) and for chromosome identification. (1) is useful as molecular marker for for chromosome identification. (1) is useful as molecular marker for contracting lectrophoresis purposes, and as therapeutic agents. (1) is also cuseful for screening compounds to identify those that mimic the PRO polypeptide (aniquists) or prevent the effect of the PR0 polypeptide (aniquists) or prevent the effect of the PR0 polypeptide care useful for immunohistochemical staining and/or assay of sample conferenting its expression in specific cells, tissue typing. PR0 antibodies are useful in diagnostic assay of sample conferenting its expression in specific cells, tissues or serum, and for altimity purification of PR0 from recombinant cell culture or natural conferences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, ss; PCR; secreted protein; transmembrane protein, PRO; cytostatic; ophthalmological; antiarthritic; osteopathic; antirheumatic; vulnerary; auditory; tumour growth, retinal disorder; sports-related joint problem; articular cartilage defects; osteoarthritis; rheumatoid arthritis; wound healing; hearing loss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
The invention describes an isolated secereted and transmembrane PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

### WPI; 2003-695924/66.

New isolated secreted and transmembrane PRO polypeptides, useful in the preparation of a medicament for treating a condition responsive to the polypeptide, and as therapeutic agents e.g. vaccines.

## Example 23; SEQ ID NO 142; 467pp; English.

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity

```
20-NOV-1998;
 in the specification (including PRO lacking its associated signal processes of the specification (including PRO lacking its associated signal peptide). A PRO extractallular domain with or without its associated signal peptide). Also included are mucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO artibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide is useful for detecting PRO337 polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO355. PRO700 or PRO739 polypeptide is useful for detecting PRO355. PRO700 or PRO739 polypeptide is useful for detecting PRO355. PRO700 or PRO739 polypeptide is useful for detecting PRO355. PRO700 or PRO739 polypeptide is useful for detecting PRO355. PRO700 or PRO739 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO337 polypeptide. The bioactive molecule is the toxin, radiolabel, or an antibody. The bioactive molecule causes death of the cell. PRO337 polypeptide is useful for linking a

## WPI; 2003-657582/62.

Novel secreted and transmembrane polypeptides, designated PRO polypeptides, and polynucleotides encoding them useful for treating kidney diseases, bone, cartilage and retinal disorders.

## Example 23; SEQ ID NO 142; 468pp; English.

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity on amino acid sequence chosen from 9% fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal

ö peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide in a sample suspected of containing PRO4993 polypeptide. Similarly, PRO4993 polypeptide is useful for detecting PRO327 polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO1559 polypeptide, and PRO1559 polypeptide is useful for detecting Gaps . 0 Length 24; Indels 59.2%; Score 14.8; DB 10; 88.9%; Pred.  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch oritice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to

 Lyberc Contract Trypanosoma brucei genome sequencing project, Sanger Centre, The Wellcome Trust Genome Campus, Hinxton, Cambridge CBIO 1SA, E-mail: barrell@sanger.ac.uk and hil@sanger.ac.uk and hil@sanger.ac.uk and hil@sanger.ac.uk and Rockville, MD. Genomic DNA isolated from a cloned population of Trypanosoma brucei (TREU927/4 GUTat 10.1) was mechanically sheared to give a tight size distribution (4 kb). The v + i method used for the library construction is described in detail in Smith, H and venter, JC. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barrell. Oxford University Press, 1999).

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarcse gel electrophoresis. Vector DNA was prepared from a derivative of pwb12 (gil #132114 [gb] AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coll X110-Gold (Stratagene) cells and selected for ampicillin resistance."

Pools of cells ware isolated from a GenomeScreen(TM) library. The library of cells ware isolated by retroviral integration of a gene tagging element consisting of: 1) A promoterless beta-lactamase proceeded by a splice acceptor as a reporter for gene expression; 2) A promoter driving neomycin resistance followed by a splice donor to trap downstream exons. 3' RACE from neomycin gene was performed using total RNA from isolated pools. Output was shotgun cloned in pAmp-1 and used to transform DH5-alpha competent bacteria. 5' ends of reported sequences were immediately preceded by splice donor from the trapping construct.

Subchtungsforschung, Carl-von-Linne-Weg 10, Koeln, 50829, Germany
This sequence has been recovered from the left border of the T-DNA.
It indicates an insertion within the locus defined by BAC clone
IT 19G15. Details on the protocols used for generation of the
sequence are described in References 1-3. The sequences are
generated at the MPI for Plant Breeding Research in the context of
the GABI-Kat project. GABI-Kat is part of the German Plant Genomics
program designated 'GABI'. Information on line availability can be
found at: http://www.mpiz-koeln.mpg.de/GABI-Kat/.
 An Arabidopsis thaliana T-DNA mutagenized population (GABI-Kat) for Flanking sequence tag-based reverse genetics Plant Mol. Biol. 53 (1-2), 247-259 (2003)
 /ecotype="Col-0"
/note="PCR was performed on DNA from Arabidopsis thaliana |
/note="PCR was performed on DNA from the T-DNA from vector PAC161 (GenBank accession number: AJ537514). The lines contain one or more T-DNA insertions. The DNA fragment(s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the insertion.

/note="Vector: PWD42Dv; Purified genomic DNA from M.
musculus C57BL/6J (female) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically shaared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end repaired with T4 DNA polymerase and T4
polymuclectide kinase. Adaptor oligonuclectides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4732114|gb|AF129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adappored vector DNA, and transformed into
chemically-competent E. coli Xil0-Gold (Stratagene) cells
and selected for ampicillin resistance."

all XhoI sites in the cDNA would be protected by their hemimethylated status. The cDNA constructs were size-fractionated with a 500bp cutoff, using Gibcobbl Life Technologies' CDNA Size Fractionation column. The column eluent was then ligated into Stratagene's pBluescript II XR Predigested vector (pBluescript II SK(+) that had been digested with EcoRI and XhoI, and phosphorylated). Both the white and blue colonies appear to contain recombinant plasmids with cDNA inserts. Blue colonies 9n=15) have been sequenced, and possess putative cDNA inserts. This library was constructed by Dr. Paul Keim & Virginia H.  GSS 13-DEC-2000
 Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TREU927/4 GUTAT 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small
innert libraries for whole genome shotgun sequencing projects. In
Genome Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barrell, Oxford University Press, 1999).
 Email: nelsayed@tigr.org
Details of T. brucei sequencing at the Sanger Centre are available
at http://www.sanger.ac.uk/Projects/T_brucei/.
 Submitted (10-DEC-2000) Trypanosoma brucei genome sequencing project, Sanger Centre, The Wellcome Trust Genome Campus, Hinxton, Cambridge CB10 1SA, E-mail: barrell@sanger.ac.uk and nhl@sanger.ac.uk

Submitted (23-OCT-2003) Balzergue S., UWRGV, INRA/CNRS, 2 rue gaston Cremieux, 91057 Evy cedex, FRANCE
Gaston Cremieux, 91057 Evy cedex, FRANCE
PCR was performed on DNA from transformants of Arabidopsis thaliana plants from INRA (versailles). The DNA fragment(s) resulting from the PCR were directly sequenced from the left or the right border to determine the genomic sequence floanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutant line and a link to a database providing a graphical display of the insertion site are available at thtp://dbsgap.versailles.inra.fr/publiclines/. This sequence has been generated in the framework of the French plant genomics program Genoplante (http://www.genoplante.com and http://genoplante-info.infopiogen.fr).

 ઠ
0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophorasis. Vector DNA was prepared from a derivative of pwM22 (gi|4732114|gb|RF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adappored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

## ALIGNMENTS

```
AAQ91121-Q91130 are nested PCR primers used for the amplification and identification of beta-cardiac myosin heavy-chain RNA. They are used in a new non-invasive method for diagnosing hypertrophic cardiomyopathy (HC), associated involves detecting the presence or absence of specific HC-associated mutations in the beta-cardiac myosin heavy-chain obtained from a blood sample. The method may be used to diagnose familial or sporadic HC and the non-invasive method is particularly important when testing
 Non-invasive method for diagnosis of hypertrophic cardio-myopathy useful for testing asymptomatic individual(8).

```

oligonucleotides capable of amplifying beta-cardiac myosin heavy-chain DNA. The method is useful for detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy. This method is especially useful for diagnosing SHC and FHC, as well as for determining the estimated the life expectancy of a person with familial hypertrophic cardiomyopathy. In particular, the method is useful for determining an individual's genetic information, and diagnosing e.g. Gaucher's disease, haemophilia, buchenne's muscular dystrophy, sickle cell anaemia, Taysachs disease, phenylectonuria or cystic fibrosis. The present sequence is a PCR primer used to amplify a region of the beta cardiac myosin heavy chain gene containing an FHC-associated mutation

Detecting mutations associated with hypertrophic cardiomyopathy to diagnose hypertrophic cardiomyopathy, comprises amplifying beta-cardiac myosin heavy-chain DNA and detecting the mutation in the amplified
 The invention relates to detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy (familial or sporadic, FHC, SHC) for facilitating the diagnosis of hypertrophic cardiomyopathy, comprising amplifying beta-cardiac myosin heavy-chain DNA forming an amplified product, and detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy in the amplified product, thus, facilitating the diagnosis of hypertrophic cardiomyopathy. Also included are a set of DNA oligomolectide primers for amplifying beta-cardiac myosin heavy-chain DNA comprising at least two oligomucleotides

ö
 This invention relates to a novel melanin-concentrating hormone receptor protein antagonist, a heterocyclic ring derivative or a salt thereof. Specifically, it refers to the development of a drug that contains this nitrogen-containing heterocyclic ring as the main skeleton of the antagonist compound, that works as the active ingredient. The present invention describes this antagonist as a melanin-concentrating hormone receptor inhibitor that exhibits anorectic activities and as such can be used to treat and/ or prevent obesity. This oligonucleotide sequence is a PCR primer used in an exemplification of the invention.
 The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection

The invention relates to nucleic acids encoding the chemokines TECK, MIP-3beta, DC CR and MDC CR. The polypeptide sequences are useful in isolating DNA clones encoding the chemokines, for generating antibodies, and for predicting oligonuclectides for screening a library to isolate species variants. A nucleic acid encoding a chemokine polypeptide can be used to identify genes, mRNA and cDNA species which encode related or homologous ligands, as well as DNA encoding homologous proteins from different species. The chemokines and antibodies which bind to the polypeptides are useful in the treatment of conditions associated with abnormal physiology or development, including inflammatory conditions such as asthma, abnormal proliferation, regeneration, adegeneration and arrophy. This sequence receptor of activated monocytes (CRAM) polypeptide, used in the scope of the invention

 The invention relates to a corn root preferential promoter fragment. The corn root preferential promoter is useful for the preferential expression of a biologically active RNA in roots of a plant, wherein the plant is a corn plant. The biologically active RNA encodes a protein of interest, which when expressed in the calls of a plant confers pest or pathogen resistance to the plant, wherein the protein is ISPAl or ISPA2 from Brevibeaillus laterosporus. An isolated DNA molecule encoding a GL4 or GL5 protein is useful for the isolation of a corn root preferential promoter region. SequencesADK70975-ADK70978 represent PCR primers for isolating corn root preferential GL5 promoter fragment.

 The invention relates to a substantially pure or isolated polypeptide comprises the mature protein of human TECK (thymus expressed chemokine) whose full larght sequence appears as ADOG7837. Also included are an isolated or recombinant nucleic acid encoding mature TECK, an expression vector comprising the nucleic acid, a host cell comprising the expression vector and a method for producing the polypeptide. Also disclosed are the mouse TECK CDNA and protein, human chemokines MIP-3alpha and MIP-3beta (and their encoding CDNAs), and the CDNAs and encoded proteins (and their encoding CDNAs), and the CDNAs and encoded proteins (corresponding to human chemokine receptors DCCR (dendritic cell receptor for chemokine) and M/DCCR (Monocyte/dendritic cell receptor for chemokine). The polypeptide is useful for treating conditions associated with abnormal physiology or development, including inflammatory conditions, e.g. asthma. An experiment was performed analysing the expression of human CRAM (not defined, unclear what its relation to TECK is). The present sequence is a reverse transcriptase (RT)-PCR primer used

```
This invention describes novel expression cassette (EC) containing at least one each of plant promoter (P) and structural gene (SG) expressed in plants, flanked by specific restriction enzyme (RE) recognition sites.

The EC has the structure (L1-P-SG-12) n where L1 = is a polylinker (ABQ76798), L2 = any of three synthetic polylinker-terminator-polylinker sequences reproduced (ABQ7699-ABQ76801) or equivalent RE-site-containing sequences and n = 1-3. The invention discloses a vector containing this EC, an organism containing the EC or the vector and a transgenic plant containing a (non-) functional nucleic acid in the vector. Transgenic plants e.g linesed can be prepared with improved production of fatty acid esters with an increased content of polyunsaturated fatty acids (BURA), useful in animal and human nutrition, cosmetics and pharmaceuticals, e.g. useful in animal and human nutrition, cosmetics and pharmaceuticals, e.g. protect against heart disease. The expression cassettes of the invention provide increased and more efficient production of fine chemicals

 The invention relates to human homologue of Drosophila melanogaster Reaper protein (hRpr) and its corresponding nucleic acid. The hRpr polypeptides are useful for generating antibodies, which can be used in detection or purification protocools designed to detect or purify the polypeptide to which the antibody is directed. These sequences are also used for screening compounds, which can enhance or inhibit hRpr and for treating tumours. The hRpr polynucleotides are useful as a probe or primer. The present sequence is a PCR primer used to amplify human hRpr open reading frame (ORF)

The invention relates to novel isolated G-protein coupled receptor (GPCR) polypeptides and polynucleotides. The GPCR polypeptide, GPCR nucleic acid and antibody are useful for treating, preventing or alleviating a GPCR-associated disorder or a pathological state in a subject, particularly a channer. In particular, the disorder is cardiomyopathy, atherosclerosis, adiabetes, or a disorder related to cell signal processing and metabolic pathway modulation. The GPCR polypeptide and nucleic acid are also useful or diagnosing the presence of or predisposition to a disease associated with altered levels of GPCR, polypeptide and nucleic acid are also useful on polypeptide are especially useful in therapeutic or prophylactic applications for disorders associated with aberrant GPCR expression or creating the above conditions. Furthermore, the nucleic acids and polypeptides are useful in treating adenocarcinoma lymphoma, prostate cancer, uterus cancer, immune response, neurodespenerative disorders, asthma, inflammatory disorders. Crohn's disease, multiple sclerosis or horight hereditary osteodystrophy. These are also useful in developing a powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications.  AAV65071-V65104 are PCR primers used in the construction of a novel vector for expression and secretion of a fertility control antigen in attenuated salmonella or other attenuated Gram-negative vaccine strains
 to produce an oral vaccine. The vector comprises a gene encoding the fertility control antigen under the control of a complete haemolysin operon, including the hly specific promoter and the hlyR enhancer-like regulator but excluding most of the hlyA gene. The vector is used for immunological contraception by oral administration
 Oral contraceptive vaccine containing recombinant salmonella -
transformed with vector containing gene for fertility control antigen.

Novel DNA for constructing knockout animals applicable in clarifying

```
The invention provides melanin concentrating hormone (MCH) receptor (MCHR) chimeric and fusion proteins. The MCHR chimeric proteins comprise MCHR polypeptide regions from different species. The MCHR fusion protein comprise MCHR polypeptide region a fluorescent polypeptide region joined directly, or via a linker, to the carboxy side of the MCHR polypeptide region. The MCHR fusion proteins can be expressed by standard recombinant methodology. MCH action promotes feeding (orexigenic) and up regulation of MCH activity stimulates food intake. Sequences AAH7313-14 represent PCR primers for amplifying mouse MCHIR cDNA, used in the construction of mouse MCHIR-linker-green fluorescent protein (GFP)
 constructing
 sequences (ADB67033-ADB67032). The sequences are useful for constructin knockout animals which are useful in clarifying the physiological function of GALP and in screening preventives or remedies for diseases due to hypo- or hyporescretion of LH, e.g. prostate cancer, ovarian cancer, gynaecological disorders, diabetes, dementia and eating disorders, e.g. obesity and other disorders. The present sequence is a primer for mouse GALP, which was used in an example from the invention.

The present sequence is a primer for the chimaeric human/murine monoclonal antibody (MAb) ONS-M21. The MAb was prepd. by combining light and heavy variable region DNA, from a murine anti-human myeloblastoma cell MAb, with human light and heavy constant region sequences, respectively to produce chimaeric human/murine light and heavy chain DNA mols. A recombinant vector for the expression of the heavy and light chain DNA mols. was prepd, and used to transform a host cell. The host cell was then cultured, and the expression prods. of the heavy and light chain DNA mols. sepd. and connected with a peptide linker to produce a single stranded FV region. The reshaped FV region has low human antigenicity, and is therefore expected to be useful as an agent for the diagnosis and treatment of cerebral tumours, e.g. myeloblastoma

 AAQ94492-Q94497 are human antibody ONS-M21 CDR PCR primers. The cDNA encoding the CDRs was used in the construction of an expression vector, contg. -CDNA encoding a human/murine chimeric antibody, reactive with human medulloblastoma (a brain tumour) cells. The chimeric antibody can be used in the diagnosis and treatment of this disease
 Reconstituted antibody against human medullo:blastoma cells - contains high proportion of human antibody origin and has low antigenicity.

The specification describes a reconstituted human antibody recognizing the peptide antigen HM1.24. This human antibody contains natural human tramework regions modified by amino acid substitutions to provide homogeneity with a previously designed framework region (which may arise from a human or non-human source); and complementary determining regions (CDR) derived from a non-human anti-HM1.24 antibody. The reconstituted antibody is useful in the treatment of diseases in which the surface antigen HM1.24 is implicated such as myeloma. The present sequence is used in the creation of the antibodies of the invention
of the H chain V region are derived from human subtype HSG1 (e.g. FR1-3 from human antibody HG3 and FR4 from human antibody JH6). The present sequence represents a PCR primer used in an example from the present invention. The antibodies are used for the treatment of myeloma, especially by injection, intravenously, intramuscularly or subcuteneously. The antibodies are used at 0.01-1000 (especially 5-100) mg/Kg body weight. The humanised antibody has low antigenicity and is therefore effective therapeutically in humans

 A humanised anti-HM1.24 antibody has been developed which comprises human L and H Chain C regions, and L and/or H chain V regions containing material originating in mouse anti-HM1.24 antibody. The V regions contain framework (FR) regions of human origin and complimentarity determining regions (CDR) of mouse origin, leading to a reshaped humanised antibody. The C regions are human Ck (L-chain) and human C gamma (especially C gamma 1) (H-chain). The RR regions of the L chain V region are derived from human subtype HSG1 (e.g. from human antibody RE1) and the FR regions
 The sequences in AAQ12685-Q12692 are primers for PCR mutagenesis and amplification of the Rei light chain variable region texmplate so as to graft the CDRs of murine 1B4 into the Rei light chain variable region.

 The YFC51.1.1 rat anti-human -CD18 light chain was humanised as follows: brimer EL (AAQ24659) was used with Primer FL (AAQ24660) in a PCR reaction using as template CAMPATH-1H light chain (i.e. humanised CAMPATH-1 on REI framework; Biotechnology 9:64-68 (1991) to produce fragment EFL. Three other PCR reactions were performed on the same template, generating fragments ABL, CDL and GHL. Fragments EFL and GHL were combined and used as the template for a PCR reaction with primers EL and HL (AAQ24662) to produce fragment EHL. Similarly, fragment ADL was produced from ABL and CDL using the primers AL and DL (AAQ24655 and AAQ24658, respectively). The products ADL and EHL were purified and combined in a recombinant PCR reaction using primers AL and HL. The final humanised light chain product, AHL, was cloned into the HindIII site of pUCL8 (primers AL and HL both contain HindIII sites). (Updated on 25-MAR-2003 to correct PN

 The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, apoptosis related proteins, cadherin, cytlin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, coupled receptors and thioesterases. The present sequence is one protein coupled receptors and thioesterases. The present sequence is one such oligonucleotide. The oligonucleotides and treatment of diseases them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, lengthistics.

 The invention comprises a method for detecting gene polymorphisms, the method involves constructing an oligonucleotide primer and/or probe containing the polymorphism site in a receptor gene or its complementary sequence, amplifying that pand detecting it with the probe and/or primer. The method of the invention is useful for the analysis of SNPs and in drug selection. The present DNA sequence represents a primer/probe
 New carbapenem compounds resistant to beta-lactamase (except metallo-beta -lactamase), useful for treating microbial infections especially respiratory infections.
 Detecting gene polymorphism for single nucleotide polymorphism analysis and drug selection.

 This invention describes a novel method for obtaining a set of biallelic markers represented in AAX2533-X52612 and AAX2533-X52843 for use in constructing a high density equilibrium map of the human genome. The method involves (a) obtaining a nucleic acid library comprising genome. DNA fragments comprising the full genome or a portion (b) determining the sequence of selected regions of the genomic DNA fragments and (d) identifying nucleotides in the genomic DNA fragments and (d) identifying nucleotides in the genomic DNA fragments which vary between individuals, thereby defining a set of biallelic markers. The methods can be used for identifying traits such as disease (e.g. Alzheimer's disease), drug response, drug efficacy and drug toxicity. They can be used for selecting an individual for inclusion in a clinical trial. The method is used to map the position of genes in a genome (preferably the human genome). The sequences described in AAX52633-X52832 and AAX52844-
 useful as antimicrobials to treat bacterial infections, especially respiratory infections in warm-blooded animals (e.g. humans). The present human DNA sequence is included in the sequence listing of this patent.

The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018 500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in bybridisation to a DNA library, in anoticoring gene expression levels by hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are strached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dottor by the any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening CDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence.html

 This invention describes a novel DNA expression construct, functional in eukaryotic cells, to prepare a vaccine, for intradermal injection, to generate a type 1 cell-mediated immune response. The construct encodes one or more antigens (Ag) under control of a promoter and, to improve transfection efficiency, is covalently linked to one or more oligopetides. The products of the invention have antiviral, were immunized intradermally (twice at an interval of 11 weeks) with a MIDGE (minimalistic immuniologically defined gene expression vector) that encoded hepatitis B surface antigen. The resulting antibody titer (expressed as optical density in enzyme linked immunosorbent assay) was concoded hepatitis B surface antigen. The interval of 12 was over 0.9. The MIDGE used was modified by binding the Tat protein-derived peptide Tyr-Gly-Arg-(Lys)_2-(Arg)_2-cln-(Arg)_3 the optical density was over 0.9. The constructs are used, particularly in human medicine, to generate a Tyr-Gly-Arg-(Lys)_2-chro) particularly in human medicine, to generate a type 1 cell-mediated immune response, specifically against hepatitis B virus surface antigen, but also against the p36 antigen of Leishmania modicine. Attachment of the oligopeptides increases transport of the moderate of the constructs are used, particularly in human medicine, to feel manner and medicine the p36 antigen of Leishmania.

 This invention describes a novel DNA expression construct for immunization against leishmaniosis which is covalently linked to one or more oilgopeptides to improve transfection efficiency. The construct consists of covalently closed DNA molecules which include a doublestranded (ds) region. The ds-forming single strands (la) antenin only the stranded raingle-stranded loops of DNA mucleotides and (la) contain only the coding region, under control of a promoter functional in the animal being immunized, and a terminator sequence. The construct is covalently linked coding region, under control of a promoter functional in the animal being immunized, and a terminator sequence. The construct is covalently linked con one or more oilgopeptides (II) to improve transfection efficiency. The products of the invention are incorporated into a vaccine which has products of the invention are incorporated into a vaccine which has a daministered intradermally (twice at 54.8 mug) to mice. Three weeks after the second injection, the animals were challenged with 50000 Leishmania and major promoastigates, injected subcutenaeously into a hind paw. After 8 weeks, the mean lesion size was 1 mm compared with over 4 mm for control animals given phosphate buffer only. The constructs of the invention constructs and without the difficulties associated with using eukaryotic expression vectors. Preparation of the vaccine is simpler and construction of pubmics.

This invention describes a novel DNA expression construct for immunization against leishmaniosis which is covalently linked to one or more obligopeptides to improve transfection efficiency. The construct consists of covalently closed DNA molecules which include a double-construct consists of covalently closed DNA molecules which include a double-stranded (ds) region. The ds-forming single strands (Ia) are linked by short single-stranded loops of DNA muclectides and (Ia) contain only the coding region, under control of a promoter functional in the animal being immunized, and a terminator sequence. The construct is covalently linked to one or more oligopeptides (II) to improve transfection efficiency. The products of the invention are incorporated into a vaccine which has protozoacide activity. An expression construct, MIDGE 936-NLS (expressing the Leishmania p36 antigen linked to nuclear localization signals) was administered intradermally (twice at 54.8 mug) to mice. Three weeks after the second injection, the animals were challenged with 50000 Leishmania major promastigotes, injected subcutaneously into a hind paw. After 8 cekeks, the mean lesion size was 1 mm compared with over 4 mm for control animals given phosphate buffer only. The constructs of the invention provide a safe, effective and productive vaccine with greater activity than the main and packet the difficulties associated with using the constructs of the invention the control of the invention than the difficulties associated with using the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control
 New DNA expression construct, useful in vaccines against leishmaniosis, comprises antigen-encoding sequence linked to oligopeptides that increase
 eukaryotic expression vectors. Preparation of the vaccine is simpler and less expensive. This sequence represents a PCR primer used in the construction of pMOKp36.

The invention relates analysing multiple targets in polynuclectide, involves providing a set or sets of multiple primers with target nucleic acids in separate reactions of primer extension or amplification, where the reactions produce nucleic acid products in that each nucleic acid fragments comprise at least one restriction site, digesting nucleic acid fragments comprises, joining digested products derived from the separate reactions on the restriction sites with cognate restriction enzymes, joining digested products derived from the separate reactions are created, amplifying the joined products, and detecting the amplified products. Also included are an oligonucleotide primer for detecting traget nucleic acid sequence (comprising a subject nucleic acid sequence (comprising a subjection comprises a restriction enzyme site, where the creatriction site acts as detection marker in the process of detecting tratest nucleic acid sequence, where the detection signal generated from enzyme site acts as detection on restriction site of reaction product is indicative of the presence of target nucleic acid sequence) and a kit for use in analysis and detection of multiple targets in a polynucleotide comprising a set or sets of multiple primers, universal primers, creatriction enzymes, DNA polymerase, ddyrp, buffers for all enzymes, and dNTPS). The method is useful for analysing multiple targets in a polynucleotide and for genotyping mutations, preferably single cucle cacid acids from any source. The method enablysing differential gene expression profiles, genonic methylation patterns and any specific contents and any source. The method enablysing differential gene expression profiles, genonic methylation patterns and any specific.

The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins coupled receptors and thioseterases. The present sequence is one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune consenses (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lugue erythromatosus and Grave's diseases), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, leukaemia), diseases of the nervous system and an infection of pathogenic

The present invention describes a method (M1) for designing capture oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridse with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Comptenin Bar virus and pollo virus, and parasitic infectious agents eslected from Onchoverva volvulus, Entamobal histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

Concerning cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCAI gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probesed entry in a computer) identified ligation to a presence or absence of the target uncleotide sequences. All Sally to the semplification.

 The present invention describes the human chromosome 11-linked coronary heart disease susceptibility gene (GHDI). Mutations in the CHDI locus in the grandline are indicative of a predisposition to coronary heart disease or to metabolic disorders related to lipid metabolism. Products from the present invention can be used in the diagnosis of predisposition to coronary heart disease and to metabolic disorders, including hypoalphalipoproteinaemia, familial combined hyperlipidaemia, insulin resistant syndrome X or multiple metabolic disorder, obesity, diabetes and dysalipidaemic hypertension. CHDI proteins can be used for treating coronary heart disease and metabolic disorders. The products can also be used for detection and drug screening. AAZ26832 to AAZ26841 and AAZ27027 coronary heart buman CHDI nucleotide sequences taged in the exemplification of the present invention. The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is and phenotype the human gene SNPS shown in the specification

(http://www.ndues_DNa.resbources/documents/dhares/). The DNA.was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoreasis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114 gip hR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into

 Zuechtungsforsching, Carl-von-Linne-Weg 10, Koeln, 50829, Germany This sequence has been recovered from the left border of the T-DNA. It indicates an insertion close to or within gene Atig05890. Details on the protocols used for generation of the sequence are described in References 1-3. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the German Plant Genomics program designated 'GABI'. Information on line availability can be found at: Location/Qualifiers
 /note_"PCR was performed on DNA from Arabidopsis thaliana plants (TI) which were transformed with the T-DNA from vector pAC161 (GenBank accession number: AJ537514). The lines contain one or more T-DNA insertions. The DNA fragment(s) resulting from the PCR were directly sequenced teatermine the genomic sequence flanking the insertion. T-DNA derived sequences were removed.
 Weisshaar, B.

Dilect Submitted (10-DEC-2000) Trypanosoma brucei genome sequencing project, Sanger Centre, The Wellcome Trust Genome Campus, Hinxton, Cambridge CB10 1SA, B-mail: barrell@sanger.ac.uk and nhl@sanger.ac.uk
Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of Trypanosoma brucei (TREU927/4 GUTet 10.1) was mechanically sheared to give a tight size distribution (
4 kb). The v + i method used for the library construction is described in detail in Smith, H. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barrell, Oxford University Press, 1999).

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polymerase and 74 polymerase and 74 polymerase and 74 polymerase and 74 polymerase and 74 polymerlectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoreais. Vector DNA was prepared from a derivative of pWD42 (gil |473214 |qb| h1229072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into
 Constructed at the Institute for Genomic Research (TICR),
Constructed at the Institute for Genomic Research (TICR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TRED927/4 GUTTAt 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small
insert libraries for whole genome shotgun sequencing projects. In
Genome Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barrell, Oxford University Press, 1999).

//note="Vector: pBluescript II SK+; Site 1: EcoRI; Site_2:
Xhof; The cDNA library was constructed from mRNA isolated
from stem tissue of 1 month old greenhouse grown plants
for the cultivar Raiden. Complementary DNA was
for the cultivar Raiden. Complementary DNA was
synthesized from mRNA using a primer consisting of a
poly(dI) sequence with a XhoI restriction site. EcoRI
adapters were ligated to the blunt-ended cDNA fragments
followed by XhoI digestion. The cDNA fragments were
directionally cloned into the EcoRI-XhoI restriction site
of the pBluescript vector. The ligated cDNA fragments were
transformed into DHUBH host cells (GibcoBRL). This library
was constructed in the laboratory of Dr. Randy Shoemaker."

 Laboratory Mouse DNR Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwapa (graph and propared from a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to
